SINCLAIR COLLEGE

BOARD BRIEFING
Building 8 · Dayton Campus

Integrated Technology Education Center

> Sinclair's Integrated Technology Strategy brings people from different disciplines into conversation and learning around a shared problem, so students connect technical knowledge with the setting in which it is used. ITEC will provide a dedicated experiential learning facility designed to create these experiences.

The building is part of the course

Students use ITEC during scheduled class meetings. A lab may serve one section for a 16-week term. Instructors can use live demonstrations or saved lab data to show how the disciplines connect within a class or across terms.

How an inspection change travels

On the APT training line Sinclair is considering, a packaging inspection could show what four teams check and how their work connects.

Robotics & controls
Test the new inspection step and measure the time per part.

Network engineering
Verify that the controller's message reaches the servers.

Instructional Server Center
Confirm that the second-level teaching servers stored the event.

Analytics & supply chain
Compare cycle times in SQL and estimate when the batch will be ready.

What students can show an employer

Students can use lab records to explain what changed, how they verified it, and what the result means for someone planning the next batch.

Where else students use these skills

Supply chain & RFID	A proposed mobile robot would move finished products to receiving. Students would match product tags and counts against the shipment record before updating inventory.
Facilities & data	Students would compare building HVAC readings on large displays and explain what Facilities should check.
Cybersecurity	The Working SNOC would monitor Sinclair's systems. In the Teaching SNOC, students would practice responding to simulated alerts.
